This classic design features a series of rectangular bands of slabs running out from a single central unit and radial lines that provide the quartered effect. Although visually complex, it is easy to create a 9 foot square as the mitered corner is in fact a single unit. Authentic character of reclaimed flagstone in a circular design with stone cut edges.

CROSS-SECTION OF TYPICAL INSTALLATION

Edge Resistant

Pavers should slope slightly away from building for water drainage

Pedestrian Traffic

4" – 6" compacted aggregate

1" Bedding Sand

INSTALLATION GUIDELINES: SAND

After excavation, compact the sub grade and install a woven separation fabric if needed. Spread and compact a base of clean, dense graded aggregate (road base). Typical compacted base thickness is 4-6’ for pedestrian applications. Pavers are set on a loosely screened 1” bed of graded, clean concrete sand. Maintain a joint size of 1/16” – 3/16” . When pavers are set, compact paving stones into sand with mechanical plate vibrator. Joint sand may be spread over paving stones during compaction. Installed pavers should be set 1/8” to 1/4” above final elevations to compensate for any potential settlement. Spread clean dry sand over surface and broom sweep to fill joints. Run vibrator one final time after filling joints.

NOTE: All measurements are nominal. Variance in square footage or linear footage coverage can be up to 5% depending on joint width. The possible occurrence of efflorescence does not affect the structural integrity of the product. Efflorescence is a normal occurrence in concrete products and will dissipate with normal weathering. The use of concrete as a base or setting bed may increase the possibility of efflorescence.

CAUTION: Always use a plate compactor with a pad when installing any textured paving stone.
